
Loading and Validating Lines

Overview

The chargeback process is initiated when receiving indirect sales from a trading partner who has requested a chargeback. These sales are loaded into Model N either through a dataflow or through a manual import. As part of the loading process, the sales are grouped together into submissions, often based on a debit memo number associated with the lines. The lines will pass through a series of validations during their initial load. If all lines in the submission pass validation, the submission is processed for payment without manual intervention. If any a line in the submission does not pass validation, that line must be adjudicated prior to initiating payment request.

Pre-requisites

Prior to loading and validating lines, the following criteria must be available:

- Contract implemented and communicated to trading partners: contract header info, eligible customers, products and prices
- Contract implemented or Price List activated with trading partners eligible for products and prices
- Customer accounts configured (DEA, HIN, GLN, 340B, Class of Trade, etc.)
- Trading partner accounts configured (EDI settings, File Formats, etc.)
- Trading partner data maps (product, customer, UOM) created, if necessary
- Trading partner to distribution center branch relationships activated
- Product profile configured (UOM Conversions, Alternate Identifiers, etc.)
- Analyst permissions granted for loading and maintaining Indirect Sale Submissions, Lines, and Chargeback Claims
- Chargeback sale configurations are complete (validations, properties, switches)

Abilities

After loading a chargeback sale file sucessfully, indirect sale submissions will be created which include lines that have completed an initial system validation. These submissions are grouped together into chargeback claims for financial settlement. At this point, the analyst can review discrepancies within the lines and take corrective actions or choose to reject the chargeback sale. If the chargeback sales are valid for payment, no action is required as the claim will automatically be submitted for payment approval.

Loading and Validating Lines

Generating Chargeback Claims

Overview

A Chargeback Claim is used to settle a payment to the trading partner from the manufacturer for the total chargeback due on all lines within all submissions associated to the claim. Chargebacks are loaded through a dataflow or via an import wizard. In both cases, only line information is present in the files being processed. The lines will be grouped into submissions and submissions will be grouped into chargeback claims based on trading partner configuration.

Debit Memo number, trading partner, currency, and fiscal period are used to locate an existing claim if the trading partner profile indicates that a new submission should be added to an open claim. If the trading partner profile indicates that a new submission should generate a new claim, then a new chargeback claim will be created for every new submission. A claim will have the payee set to either the trading partner or distribution center branch based on the trading partner's Payee Rule.

Prerequisites

- Trading partner's Sales Submission Grouping Rule must be defined as this is used to load indirect sales via a dataflow and this rule is the default option when importing via wizard.
- Trading partner's Claim Rule must be defined as this is used to assign submissions to chargeback claims during the indirect sale loading process.
- Trading partner's Payee Rule must be defined as this is used to set the default payee to either the trading partner or distribution center branch on newly generated chargeback claims during the indirect sale loading process.

Note: If the grouping rule is not pre-defined for the trading partner, a default configuration will be used.

Related Articles

Generating Indirect Sales Submissions

Generating Indirect Sales Submissions

Overview

Submissions are containers of sale lines which are used for to:

- provide summary information such as total amounts and line count
- organize large volumes of transactions into more manageable units of work
- perform actions that will apply to all lines in the submission.

Indirect Sales are loaded through a dataflow or via an import wizard. In both cases, only line information is present in the files being processed. However, the lines will be grouped together into sales submissions which are automatically generated every time the lines are loaded.

Note: Newly loaded lines will never be added into existing submissions.

For indirect sales, generation is determined based on the Sales Submission Grouping Rule defined in the trading partner's profile. All grouping rules will include Sale Type (Tracing, Chargeback), Organization (US, Canada), and Currency by default. Additionally, grouping will be based on options for Trading Partner, Distribution Center Branch, Debit Memo, and Domain (Government, Commercial). By default, the Sales Submission Grouping Rule includes Debit Memo and Trading Partner.

Prerequisites

A trading partner's Sales Submission Grouping Rule must be defined as this is used when loading indirect sales via dataflow and this rule is the default option when importing via wizard. Note that if this is not defined for the trading partner, the default configuration will be used.

How To Import a File Using a Data Flow

Navigation Path

Administration > Data Flows > Dataflows

Prerequisites

Before uploading sale lines using data flows, you need to have an

- Updated sale line (.csv file)

To perform upload using dataflows, you need to have access to the sale line to be uploaded.

1. Click **Administration** in the toolbar and click **Dataflows**.
2. Search for data flow, **BothSaleFromDirectLoader**.
3. Select checkbox for BothSaleFromDirectLoader.
4. Click on the **Import** button.
This opens the Execute Flow via File Import page.
5. Enter the **Project Name**, which is a required field.
6. Browse to the file (.csv)for import that has the sale line information.
7. Select the **Organization**, which is a required field using the Select organization dialog box.
8. Click **Start**.
This opens the Dataflow Results page.

You can verify that the sale line imported by scanning the sale line

- 1. Navigate to **Sales > Indirect Lines**.
- 2. Search for information specific to the sale line that was imported. For example, Debit Memo #.
- 3. Click the **Line #**.
The tabbed display details the sale line details.
- 4. Verify the details of the sale line.

Abilities

The uploaded data provides the analyst with information specific to the chargeback claims and processes them for the wholesaler.

Related Articles

[Sale Line Details Page](#)

Importing Chargeback Sales Using an Import Wizard

Overview

For some trading partners who are unable to submit chargebacks using EDI, uploading the lines through the application is another alternative. The analyst will be required to format the data into a .csv file and maintain the mapping between the chargeback sale columns and the file columns. These formats can vary by trading partner.

Note: Only original and credit/rebill chargebacks can be loaded using the import wizard.

Prerequisites

Before uploading sale lines using data flows, you need to have an

- Updated sale line (.csv file format)
 - All date formats must follow mm/dd/yyyy
 - Leading 0's should not be removed, for example, the leading 0's padded to the Contract ID (10 digit number)
- Indirect sale file format (default or trading partner specific) is defined
 - Note:** Trading partner file format can be updated during import process
- See Loading and Validating Chargebacks Pre-requisites

Abilities

After importing chargeback sales using a wizard, claims and submissions containing the lines will be created and available for adjudication. Lines will pass through an initial validation and set their severity. Audit information will be captured indicating that the analyst is responsible for the chargeback upload in order to differentiate it from chargebacks loaded electronically.

Loading Chargebacks Sales Using a Data Flow

Overview

The dataflow used to load chargebacks is EdiIndirectSaleFromDirectLoader. This is used to load original or credit/rebill chargebacks.

Navigation Path

Administration > Data Flows > Dataflows

Prerequisites

Before uploading sale lines using data flows, you need to have an

- Updated sale line (.csv file)

General Information

Name: EdiIndirectSaleFromDirectLoader

Direction: Inbound

File Path: Importers/Edi/IndirectSaleFromDirectLoader

File Format: .csv

Max Errors: 1

Owner: INTG-ADMIN-TYPE

Properties:

Name	Value	Descriptions
.SaleType	BOTH	All lines loaded using this dataflow will be loaded as sale type = BOTH.
.ValidationConfName	EdiIndirectSaleValidation	Defines properties, tasks, and messages used by the dataflow during initial load and subsequent revalidation.
.LoadingConfName	EdiIndirectSaleLoading	Defines properties, tasks, and messages used by the dataflow only during initial load.

Default Field Information

The following table provides the dataflow details

Field Name	Description	Required
ExternalCurrency	The currency used for all amount field Default: USD	Yes
ExternalParentDistrDebitMemo		Yes
ExternalParentDistrBranchId		Yes

Abilities

The uploaded data provides the analyst with information specific to the chargeback claims and processes them for the wholesaler.

Loading Chargebacks Using Import

Overview

You can import claim lines via the electronic transmission interface into the Model N system and loaded through import wizard. You can configure the process to run on a daily basis to pull in the chargeback claims.

Navigation Path

Sales > Import Indirect Submissions > Sales Submission Upload

Prerequisites

Inorder to import data, the system must have:

- Customer of type - Wholesaler must exist in the system
- .csv file format for upload

To import claim lines

Step 1 of 4: Select a File

1. In Name of File to Import section, select **Browse** to navigate to the file for import.
2. Select **Organization** using the chooser.
3. In Submission Line Type, select an option:**Chargeback**, **Tracing (867)**, or **Both**.

4. In Use Saved File Format from the Following Customer section, use the chooser to select the **Wholesaler**.
5. Click **Next**.

Step 2 of 4: Provide File Information

The information here is auto populated based on the selection made in Step 1.

1. In the Enter Header Information section, the following fields are auto populated:
Wholesaler
Wholesaler Name
Received Date
External Report Date
2. Enter the **Line Count**.
By default the headings in the imported file are displayed on Line 1 and the data begins on Line 2.
3. Add the **Total Quantity**.
4. In the Grouping Lines section, the **Wholesaler** and **DM#** are selected by default.
5. Click **Next**.

Step 3 of 4: Preview and Edit File Format

The information displayed is based on the (.csv file) data imported. The system displays the filename and path from which the data is imported.

1. Enter the line number from which to start the data import.in **Start import at Line #**.
2. Verify the column headings based on the imported data, make the necessary changes using the drop down list.
3. To save your changes to the file, click the **Save File Format Changes** button.
4. Click **Next**.

Step 4 of 4: Review Results

The system displays the imported file name, the correlated data flow, the upload status, the Start Date and End Date for the File Import. The validation messages for the imported data is displayed in the Messages section.

1. Click **Refresh** to view the upload status.
You can search through the messages to display Errors or Warnings.
2. Click **Finish**.

Abilities

You can use the imported data for the chargeback lines to:

- process the lines
 - make corrections to the chargeback lines as needed through overrides
 - validate the lines
-

Receiving Original or Credit/Rebill Chargeback Sales (Electronically)

Overview

Original lines refer to lines that have never been loaded before; these are the most common type of chargeback line. If an original line was loaded, processed, and paid without discrepancy and then, at a later point an issue was discovered, the line can be credited and rebilled to the end customer. This results in two lines being submitted that will be processed and paid:

1. credit – mirror negative of the original, and
2. rebill – new line with updated information.

Chargeback sales are primarily submitted by trading partners through electronic means such as EDI (844, 867) to manufacturers. When the transaction purpose code is an original or a credit/ rebill, the lines are loaded as initial lines with no dependence on other lines in the system. Lines are loaded with a status of 'In Process' which allows the analyst to adjudicate any discrepancies on the lines.

Note: There is no link from original to the credit/rebill line, though it is common for trading partners to use the original invoice number and dates when performing credit/rebills.

Prerequisites

- Configure and Run dataflow 'EdiIndirectSaleFromDirectLoader'
- Loading and Validating Chargebacks Pre-requisites

Abilities

Upon successfully receiving original or credit/rebill lines, the lines will be grouped into Sales Submissions and Chargeback Claims. Lines will pass through an initial validation and have their severity set. Any non-valid lines having discrepancy will be available for analyst adjudication.

Receiving Resubmitted Chargeback Sales (Electronically)

Overview

Some trading partners have the capability to send resubmission data electronically using the EDI 844 transaction. Resubmissions occur once an original line is rejected fully or partially due to missing or inaccurate data submitted by the trading partner. The trading partner can address the issue and resubmit chargebacks with the corrected information. On receipt of the resubmission, the application will find the original closed line, create a negative 'reversal' of it, and load the updated information as a 'replacement' line. At this point, the replacement line can be adjudicated normally, whereas the reversal line is non-editable. The Line History information on a given line will show the linkage between the original, reversal, and replacement lines.

In order for an electronic resubmissions to work properly, original lines must have their line resubmission id set. This id is submitted by the trading partner on all original lines, communicated back to the trading partner during reconciliation, and referenced again on the electronic resubmission from the trading partner. The combination of debit memo number and line resubmission id must be unique as it is used to find the original line and resubmit it.

Note: The Line History information on a given line will show the link between the original, reversal, and replacement lines.

Example: Electronic Resubmission

Line Information	Reversal Status	Lifecycle Status	Chargeback Request/Paid	Discrepancy
L1 (Original)	None	Closed	\$100/ \$80	\$20; invalid contract
Resubmission of original line occurs at some point after original is closed, resulting in:				
L1 (Original)	Replaced	Closed	\$100/\$80	\$20; invalid contract
L2 (EDI resub line)	Replacement	Open	\$100/\$100 *\$20 actual request	\$0; contract corrected
L3 (Negative qty of L1)	Reversal	Open	(\$100)/(\$80)	\$20; invalid contract

* This indicates that the trading partner has resubmitted for the incremental chargeback amount outstanding vs. the full amount of \$100 again; which is configured in trading partner profile.

Prerequisites

- Original line must be in Closed status and have a line resubmission id set that will be referenced on the incoming replacement line and used to find and resubmit the original
- Configure and Run dataflow ‘EdiIndirectSaleResubmissionFromDirectLoader’
- See Loading and Validating Chargebacks Pre-requisites

Abilities

On receiving resubmitted lines, the resulting reversal and replacement lines will be grouped into new Sales Submissions and Chargeback Claims. Replacement lines will pass through an initial validation and have their severity set. Any non-valid replacement lines having discrepancy will be available for analyst adjudication. The original line will be have its reversal status changed from ‘None’ to ‘Replaced’ and Line History information on any of the 3 lines will display the relationships between those lines.

Resubmitting a Chargeback Sale (Automatically)

- Overview
- Prerequisites
- Auto-Resubmission Process
- Abilities
- Related Articles

Overview

The auto-resubmission process refers the ability for the Model N system to recognize backdated changes to customer and product/price eligibility on contracts, and automatically resubmit those previously closed sale lines that may be affected by the change. To do this, the system will identify all closed sale lines with that internal customer or product having an invoice date between current date and the effective start date of the change, and resubmit them.

This allows for changes made during normal adjudication process to ensure that all lines possibly impacted by the change are considered, even those that were previously closed. This alleviates the chargeback analyst from having to first wait for confirmation from other internal parties as to the actions taken (e.g. membership added, contract amended), manually search for lines they suspect may be impacted by the change, and finally initiate resubmission. Instead, any change occurring in the past which could impact an implemented contract, and therefore existing sale lines, can trigger auto-resubmission.

Note: Auto-resubmission is enabled at the time of system implementation based on the app switches configuration.

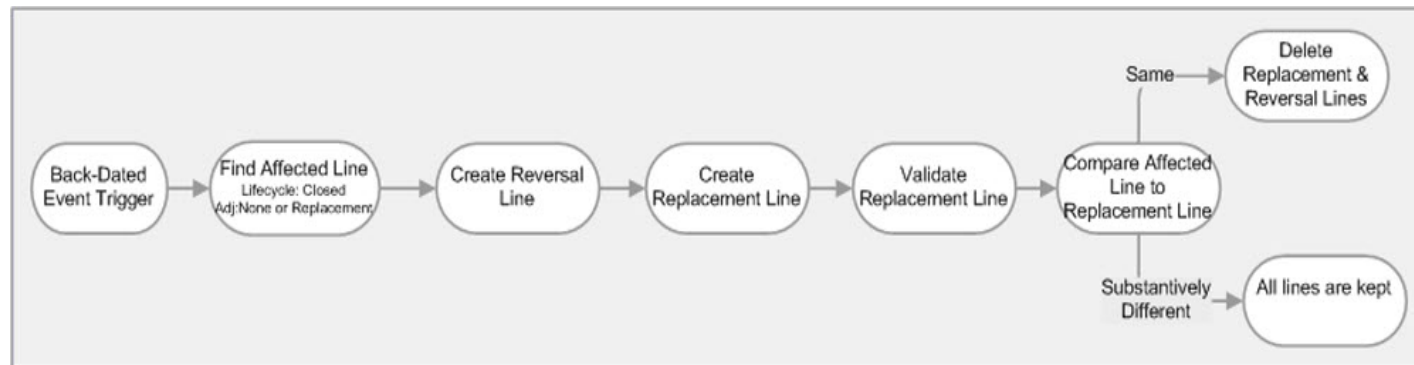

Prerequisites

Depending on the sale type (indirect, direct, custom), Model N must be configured to trigger auto-resubmission on a scheduled basis.

Auto-Resubmission Process

(Customer/product change made that impacts contract) -> (is this backdated) -> (If yes, find lines having this customer/product between change start and today) -> (resubmit)

The following figure illustrates the high-level process flow for an auto-resubmission.

Abilities

Closed sale lines will be automatically resubmitted due to back dated changes resulting in reversal and replacement lines. Examples of these changes include: implementing a new contract that starts in the past, adding a customer commitment, amending and adding a product or changing a price, modifications to membership or other customer attributes being used to filter customer eligibility, setup of a data map.

[Revalidating a Sale Line/Submission \(Manually\)](#)

[Resubmitting a Chargeback Sale \(Manually\)](#)

Resubmitting a Chargeback Sale/Submission (Manually)

Overview

The most common method to resubmit lines is through the manual mechanism: email, fax, or hardcopy. Resubmissions occur once an original line is rejected fully or partially due to missing or inaccurate data submitted by the trading partner. Upon receipt of the resubmission request, the analyst will search for and find the original closed line and resubmit it.

The Resubmit action creates two new lines: a non-editable 'reversal' of the original line and a 'replacement' line which can be adjudicated using new information provided by the trading partner. The Line History information on a given line will show the linkage between the original, reversal, and replacement lines.

Prerequisites

See 'Loading and Validating Chargebacks' Pre-requisites

Abilities

When one or more lines have been manually resubmitted, the resulting reversal and replacement lines will be grouped into new Sales Submissions and Chargeback Claims. Replacement lines will pass through an initial validation and have their severity set. Any non-valid replacement lines having discrepancy will be available for analyst adjudication. The original line will have its reversal status changed from 'None' to 'Replaced' and Line History information on any of the 3 lines will display the relationships between those lines.

[Adjudicating Discrepancies](#)

Revalidating a Sale Line/ Submission (Automatically)

Overview

The auto-revalidation process refers the ability for the Model N system to recognize backdated changes to customer and product/price eligibility on contracts, and automatically revalidate those sale lines that may be affected by the change.

To do this, the system will identify all open sale lines with that internal customer or product having an invoice date between current date and the effective start date of the change, and revalidate them.

This allows for changes made during normal adjudication process to ensure that all lines possibly impacted by the change are considered. This alleviates the chargeback analyst from having to first wait for confirmation from other internal parties as to the actions taken (e.g. membership added, contract amended), manually search for lines they suspect may be impacted by the change, and finally initiate revalidation. Instead, any change occurring in the past which could impact an implemented contract, and therefore existing sale lines, can trigger auto-revalidation.

Prerequisites

- Depending on the sale type (indirect, direct, custom), the Model N must be configured to trigger auto-revalidation on a scheduled basis.

Auto-Validation Process

(Customer/product related changes to an implemented contract that impacts contract) -> (is this backdated) -> (If yes, find lines having this customer/product between change start and today) -> (revalidate)

Abilities

Open sale lines will reflect the impact of back dated customer and product eligibility changes automatically. Examples of these changes include: implementing a new contract that starts in the past, adding a customer commitment, amending and adding a product or changing a price, modifications to membership or other customer attributes being used to filter customer eligibility, setup of a data map.

Revalidating Sale Line/Submission (Manually)

Overview

All sale lines that are loaded into the Model N system will pass through an initial set of validations. It is common for any lines having issues, to be revalidated once the issue has been addressed. A single line or submission (and therefore all lines in the submission) and multiple lines or submissions can be revalidated.

Abilities

The line will go through a full revalidation which results in it being updated with the latest internal information (e.g. customer, contract, product, quantity, etc.) and displaying any new validation messages.

Related Articles

[Revalidating a Sale Line/Submission \(Automatically\)](#)

Reversing a Chargeback Sale/Submission (Manually)

Overview

In rare situations, it is necessary to reverse a previously processed (closed) indirect sale lines without generating replacements. This may occur when a chargeback sale was improperly adjudicated and paid. The Reverse action creates a new line that is a negative of the original line; i.e. quantity is multiplied by -1. A single line, multiple lines, or an entire submission can be reversed. The new lines will be grouped into new submissions and new claims. Note that the new reversal lines cannot be modified.

Example: Line Reversal

Line Information	Reversal Status	Lifecycle Status	Submission	Claim #
L1 (Original)	None	Closed	9988-000	12345:\$100
Resubmission of original line occurs at some point after original is closed, resulting in:				
L1 (Original)	Reversed	Closed	9988-000	12345:\$100
L2 (Negative qty of L1)	Reversal	Open	9988-001	98765:(\$100)

Prerequisites

- Original line must be in Closed status

Abilities

When one or more lines have been reversed, the resulting reversal lines will be grouped into a new Sales Submissions and Chargeback Claim.

The original line will have its reversal status changed from ‘None’ to ‘Reversed’ and the Line History information on both lines will display the relationship between those lines.
